

Safety system

These steps clearly explain you how the push away safety system works. It is simple and safe.

Follow these steps every time before riding, because the safety system can get worn out and may not work properly. So before every riding sessions, check carefully if the safety system is working.

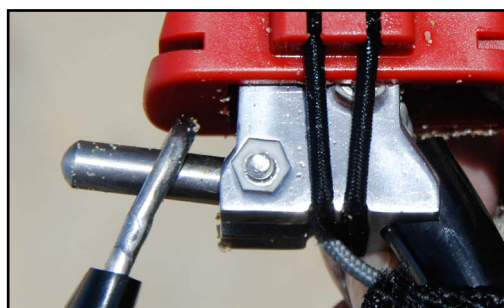

1. In case of an emergency, simply push away the red plastic part with "C" logo.

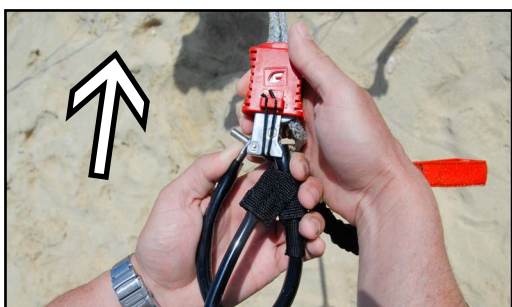

2. This releases the safety pin.

3. Now the chicken loop is opened. This kills rapidly the power of the kite. You are now connected to the kite only via the safety leash, which should also be releasable in a case of extreme emergency.

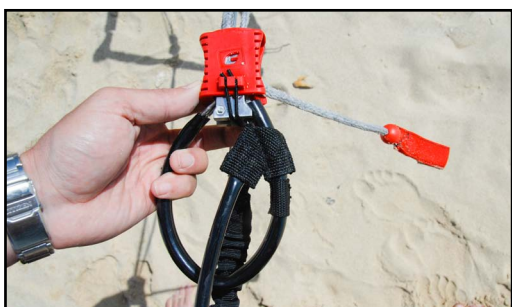

4. To re-assemble the safety system, put the metal oval ring of the chicken loop on the safety pin.

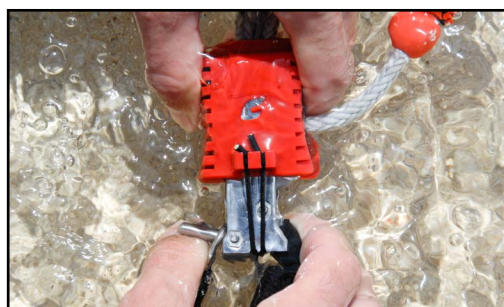

5. Hold the chicken loop in your left hand and the red plastic safety part in your right hand and push away the red plastic safety part.

6. This opens the space to put the safety pin back inside. Push the safety pin back inside the metal part and slowly slide down the red plastic safety part.

7. Make sure that there is no sand or dirt inside the safety system.

8. Rinse the safety system with clean water after every ride if possible.
